# LEARNING OBJECTIVES

After completing this module, you can:

1

Explain the **benefits of design thinking** for collaborating with stakeholders

2

Identify the **steps** of design-thinking

3

Recognize the **issues** significant for applying design thinking with stakeholders

# WHAT IS DESIGN THINKING?

Design thinking is a mindset approach to problem solving and innovation that revolves around **human-centered design**.

It is **solution-based and user-centric**, rather than problem-based, which means it focuses on the solution to a problem, rather than the problem itself.

# WHAT IS DESIGN THINKING?

The approach emphasizes understanding the user's perspective and identifying the challenge before jumping into solutions. Therefore, the initial stage of design thinking involves **empathizing with the target audience** to gain a thorough understanding of their needs and challenges.

# WHAT IS DESIGN THINKING?

**Design thinking** is particularly useful for social innovation, which involves developing new or improved interventions or services to address social or environmental challenges and generate positive impact.

This approach can facilitate **collaboration with individuals from diverse perspectives**, enabling organizations and communities to discover new opportunities, co-create innovative ideas, and validate solutions in real-world scenarios.

# WHAT IS DESIGN THINKING?

Key elements of **design thinking**:

- Thinking through **visualization**, storytelling, and experimentation by building and testing prototypes.
- This approach helps bridge gaps between the **perspectives** of those involved in a challenge and the insights of the researcher or expert.
- Because these perspectives come together in a **design-oriented manner**, it often leads to more innovative solutions for approaching challenges.

## Flexibility and comfort with ambiguity

Adaptability is key in addressing ambiguously defined societal challenges. The design thinking mindset embraces uncertainty and ambiguity, allowing for flexible approaches to problem-solving.

# HOW DOES DESIGN THINKING WORK

Design thinking generally consists of **five activities**. Although presented as steps, it is important to recognize that design thinking is not strictly linear. Rather, the steps can be considered as **distinct modes or spaces for navigating the design process**.

**The level of stakeholder participation** may vary per phases and should align with the core objective of the project. In design thinking, multiple iterations occur throughout the various phases.

The design thinking process typically begins with 'Identify' (empathize and define) and then 'Solve' (create, prototype, and test).

This **non-linear structure** encourages the rapid generation of potential solutions, recognizing that they may be incomplete or flawed, which facilitates learning and refining solutions.

## Emphasize

The initial step in design thinking is to **gain a deeper understanding** of the challenge from the user's perspective. To achieve this, it is recommended to become fully immersed in the physical context of the challenge, such as a neighborhood or community.

Qualitative methods, such as observation, interviews, group discussions, workshops, and other approaches, are highly prioritized in design thinking. Insights can be obtained from literature reviews, experiments, or any other analytical processes.

## Define

In this step, the team (ideally also including the stakeholders) **collaboratively identifies and reaches consensus on the insights that appear most interesting and relevant.** If reaching unanimous agreement is challenging, consider a more systematic approach by grouping insights into clusters based on common stakeholders, institutions, or other relevant factors.

**Ideate**

During this step, the team engages in a **brainstorming session** to generate potential solutions, using the problem statement as a focus. The principle of 'no judgment' is emphasized, meaning that there are no wrong solutions, and the group avoids debating or critiquing at this stage. The goal is to capture a wide variety of solutions, prioritizing quantity over quality.

# HOW DOES DESIGN THINKING WORK

**Ideate**

There are several methods that can facilitate a brainstorming session. One example of such a method is as follows:

Each group member writes down the first solution that comes to mind. Solutions are then shared one-by-one, layered on the table, with the next person adding or introducing new solutions that build on the previous ones. This process consists of multiple two-minute rounds, which encourage innovative ideas due to time pressure.

# HOW DOES DESIGN THINKING WORK

Ideate

After the brainstorming session, a variety of ideas should emerge. It may be advantageous to establish a **set of criteria** for the desired solution and then evaluate and select ideas that meet these criteria.

These criteria may include:

- **Desirability**: is this what the organization or community wants/needs?
- **Feasibility**: can we deliver the solution?
- **Viability**: is the solution aligned with long-term goals?

## Prototype

During this step, the objective is to **create a physical or conceptual prototype of the selected solution**. The main purpose of prototyping is to concretize the concept and identify potential blind spots. Prototyping is therefore an essential activity in design thinking employed to examine and improve concepts by testing different variations. The team may develop multiple prototypes before choosing one or more to showcase to individuals who could benefit from or utilize the solution.

## Test

The purpose of this step is to **receive feedback** on concept prototypes and the ideas and assumptions embedded in them. In the design thinking process, feedback is used to make enhancements, particularly in the early stages.

**This is not the final step**, as the feedback serves to educate and discover, not just confirm. Potential prototypes should be presented to stakeholders as soon as possible, especially those who may be affected by the solution. Their input can facilitate prompt improvements.

## The challenges of using design thinking with stakeholders

Using design thinking with stakeholders can present **challenges** due to their varying backgrounds, expertise, and resources. While this approach can be beneficial for addressing societal challenges, it may also complicate the design thinking process. As stakeholders have individual goals and interests, frictions can arise, such as:

- A **vague or inaccurate** challenge definition.
- **Deviation** from the original goals
- **Resistance** from stakeholders to further involvement in the project.

## The tools to support stakeholder management in design thinking

Stakeholders can benefit from new perspectives, insights, and innovative approaches to the problem. **Co-creation** facilitates the generation and maintenance of stakeholder commitment to the project. The project's eventual outcome can be positively influenced by **actively engaging stakeholders** in every activity, fostering a sense of ownership.

## The tools to support stakeholder management in design thinking

In projects involving diverse stakeholders with different interests, it is essential to align these perspectives. By helping stakeholders understand the perspective and experiences of these organizations or communities, they are more likely to be open to alternative solutions, rather than solely adhering to their own interests. Therefore, it is important to involve stakeholders in “empathize” activities.

Inviting individuals from the organization or community with whom you are collaborating to share their viewpoints and experiences regarding the solution being developed helps create an open forum for collaborative discussion and reflection. In this way, there is an open space for sharing opinions and co-creation that fosters reflection and discussion.
